COLLEGE EVENT MANAGEMENT SYSTEM

The proposed College Event Management System will be a web-based application developed to simplify the organization and management of college events. The system will provide a centralized platform for students, organizers, and administrators to manage event-related activities efficiently. In addition to standard event management features, the system will incorporate a Machine Learning-based recommendation module to improve student engagement and participation.

Objectives

- Automate the event management process.
- Provide a convenient platform for event registration and participation.
- Simplify attendance tracking through QR code verification.
- Collect and analyze participant feedback.
- Recommend relevant events to students using Machine Learning techniques.

Key Features

- User registration and secure login.
- Event creation, modification, and management.
- Online event registration and participant tracking.
- QR-code-based attendance system for fast and accurate attendance recording.
- Feedback and rating module for collecting participant opinions after events.
- Machine Learning-based event recommendation system that suggests events based on a student's interests and previous participation history.
- Administrative dashboard for monitoring registrations, attendance, and feedback statistics.

Technology Requirements

- Frontend: HTML, CSS, JavaScript
- Backend: Python, PHP, or Node.js
- Database: MySQL
- Machine Learning
- Platform: Web-Based Application

Expected Benefits

- Reduced manual effort in event management.
- Improved accuracy in attendance and record keeping.
- Better understanding of participant satisfaction through feedback analysis.
- Increased student participation through personalized event recommendations.
- Efficient management and monitoring of college events.

Conclusion

The College Event Management System with Event Recommendation System will provide an efficient and intelligent solution for managing college events. By combining event management, QR-based attendance, feedback collection, and Machine Learning-driven recommendations, the system will enhance user experience, improve participation rates, and support better decision-making for organizers and administrators.
